**ANTENNA FOR PORTABLE COMMUNICATION
DEVICE EQUIPPED WITH A HINGE**

Abstract

A portable communication device includes a first part including a first antenna element located within and extending through a portion of the first part and radio circuit feeding antenna elements, a second part hingedly joined to an end of the first part for providing at least one open and one closed position of the phone, and a hinge element connected to the first and second parts. The hinge element stretches along the end of the first part for providing rotation of one part in relation to the other part around a first axis having a first and second end. The hinge element includes a second antenna element. The radio circuit is connected between the first and second antenna elements.
